ABSTRACT OF THE DISCLOSURE

Incident signal beam pulses are transmitted by an onstate region, and an optical path for the signal beam pulses
is spatially switched in an optical switch. Signal beam pulses
transmitted by the on-state region of the optical switch are
detected at a pixel corresponding to a transmitting region of
a photo-detector equipped with a plurality of pixels. A timing
computation unit acquires position information of a pixel at
which a predetermined signal beam pulse has been detected, on
the basis of a result of the detection conducted by the
photo-detector, and computes timing of arrival of a
predetermined signal beam pulse at the optical switch on the
basis of the position information of the pixel and time when
a region corresponding to the pixel is brought to an on-state.
